

1. What is CSS Flexbox? Explain its properties.
 2. Explain different events of JavaScript.
 3. Differentiate between GET and POST methods in AJAX.

 4. What is Web Server? Explain key features.
 5. Explain Node.js and its role in server-side JavaScript development. Also, define NPM and discuss its purpose and significance in the Node.js environment.
 6. What is the Express framework? Discuss its features and advantages.
 7. Explain the role of the Node.js Event Loop in handling non-blocking I/O operations. Also, describe how `async/await` simplifies asynchronous programming on the server side.
-
8. Develop a dynamic "Product Filter" component for an e-commerce landing page using HTML, CSS (Flexbox), and JavaScript.
 1. **Task A:** Design a responsive layout using **CSS Flexbox** to display a list of product cards. Each card must include an image, title, and price.
 2. **Task B:** Implement a **JavaScript Event Listener** on a search input field. As the user types, the product list should be filtered in real-time without reloading the page.

 9. Create a new Node.js project and implement basic routing using Express.js.
 1. Create a new project folder and initialize it using `npm init -y`.
 2. Install Express using `npm install express`.
 3. Create a file named `app.js` and implement the following routes using `app.get()`:
 - Home Route (/): Display a heading: *"Welcome to My Website"*.
 - Contact Route (/contact): Display your email address.
 - User Route (/user/:name): Create a dynamic route that displays a message like *"Hello, [name]!"*.
